TrueGrain®*

MOISTURE SENSOR SYSTEM

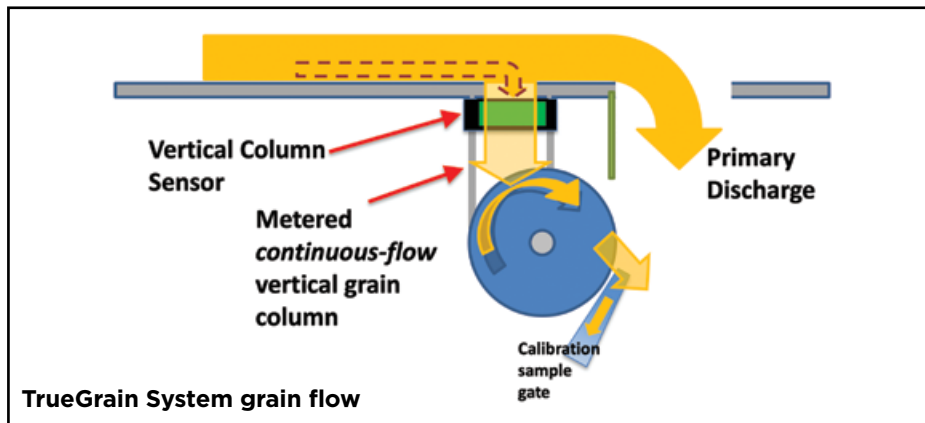

Grain dryers are only as accurate as their ability to measure moisture content and temperature. The problem with most existing drying systems is that grain flowing across horizontally mounted sensors creates inherent variability and measuring inaccuracies. That's why Brock created the TrueGrain® Moisture Sensor System* — a more consistent and accurate way to direct grain flow and measure grain moisture.

Standard sensor system grain flow

Changing grain flow for consistent measurements

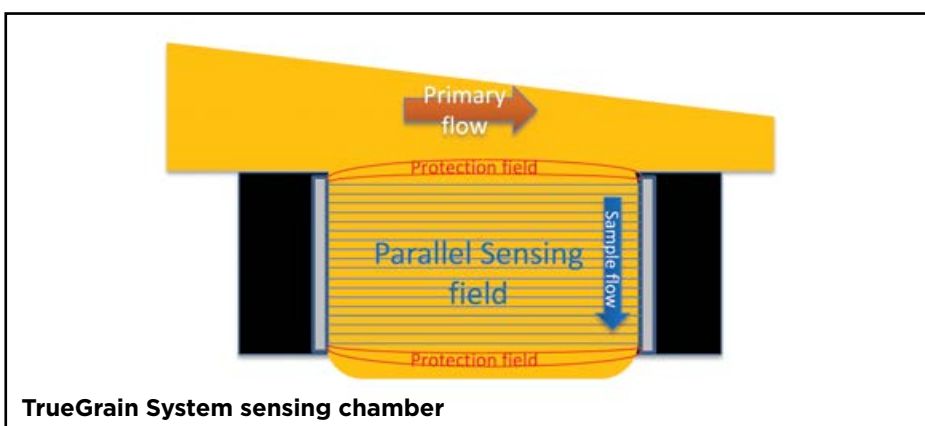

With the TrueGrain System, grain is metered through a vertical chamber at a constant speed that provides a uniform sensing area. This unique design prevents fines and condensation from accumulating which could distort measurements. The metering wheel also provides convenient access to grain samples for manually cross-checking moisture content.

TrueGrain System grain flow

Improving accuracy with Parallel Sensing Technology®

Grain passes through a parallel sensing field in a fixed vertical chamber that is isolated from factors such as buildup of grain fines, ambient temperature, condensation and electrical noise. The temperature probe is also located in this chamber for accurate measurements.

TrueGrain System sensing chamber

Safeguarding Your Grain® Since 1957

TrueGrain® Moisture Sensor System*

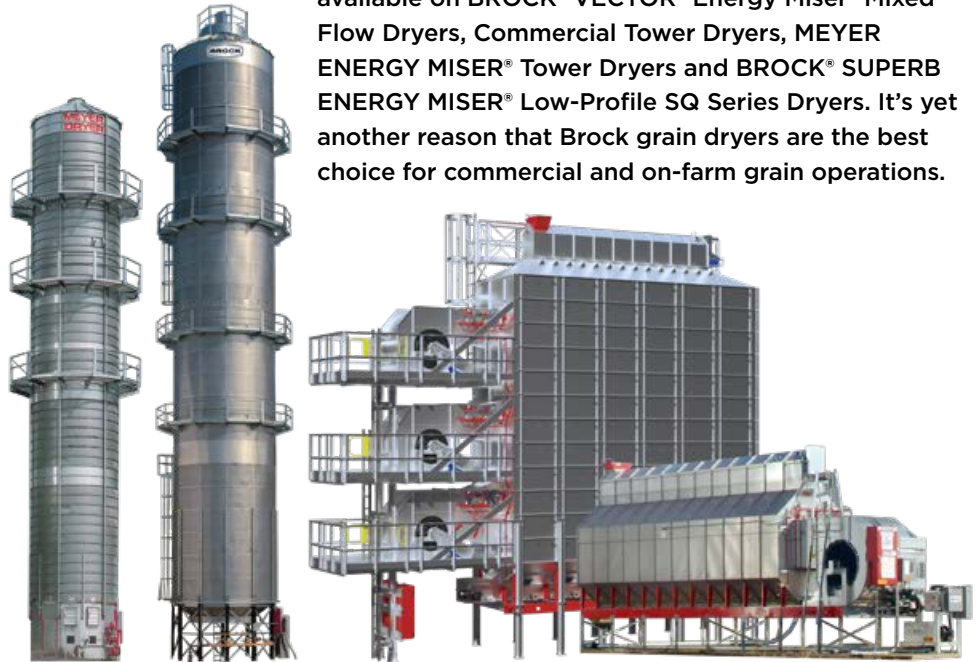

Works with Brock's INTUI-DRY® Controller

The INTUI-DRY System provides true moisture-based control utilizing incoming and outgoing grain moisture sensors. It features an easy-to-use touch-screen interface with web-based monitoring for remote operation.

Available exclusively with Brock grain dryers

The TrueGrain Moisture Sensor System is only available on BROCK® VECTOR® Energy Miser® Mixed Flow Dryers, Commercial Tower Dryers, MEYER ENERGY MISER® Tower Dryers and BROCK® SUPERB ENERGY MISER® Low-Profile SQ Series Dryers. It's yet another reason that Brock grain dryers are the best choice for commercial and on-farm grain operations.
